Package 'TTMap'

May 16, 2024

Type Package

Title Two-Tier Mapper: a clustering tool based on topological data
analysis

Version 1.27.0

Date 2017-07-12

Author Rachel Jeitziner

Maintainer Rachel Jeitziner <rachel.jeitziner@epfl.ch>

Description
TTMap is a clustering method that groups together samples with the same deviation in compari-
son to a control group. It is specially useful when the data is small. It is parameter free.

License GPL-2

Contents

TTMap-package   *Two-Tier Mapper: a clustering tool based on topological data analysis*

Description

TTMap is a clustering method that groups together samples with the same deviation in comparison to a control group. It is specially useful when the data is small. It is parameter free.

Details

The DESCRIPTION file: TTMap/DESCRIPTION Version 1.0

Author(s)

Rachel Jeitziner Maintainer: Rachel Jeitziner <rachel.jeitziner@epfl.ch>

References

Examples

```
#to be found in \code{\link[TTMap]{ttmap_sgn_genes}}
```

calcul_e   *Calculation of the value of epsilon*

Description

Calculation of the value of epsilon

Usage

```
calcul_e(dd5, pvalcutoff = 0.95, tt1, alpha = 1, S =
colnames(tt1$Normal.mat))
calcul_e_single(dd5, pvalcutoff = 0.95, tt1, alpha = 1, S =
colnames(tt1$Normal.mat))
```

Arguments

dd5	distance matrix as created by generate_mismatch_distance
pvalcutoff	cutoff of 0.05 percent (default) or less
tt1	output of control_adjustment
alpha	a cutoff value for the FC between the group of control and the disease group
S	subset of columns to be considered

Value

al	number representing the cutoff to choose for the relatedness with dd5

Author(s)

Rachel Jeitziner

        select=rownames(TTMAP_part1_hda$Dc.Dmat), alpha = ALPHA)
        e <- TTMap::calcul_e(dd5_sgn_only, 0.95, TTMAP_part1prime, 1)
```

---

control_adjustment   *Calculates a corrected control group, discovers outliers in it.*

Description

control_adjustment function finds outliers in the control group and removes them

Usage

```
        control_adjustment(normal.pcl, tumor.pcl, normalname, dataname,
        org.directory = "", A = 1, e = 0, meth = 0, P = 1.1, B = 0)
```

Arguments

normal.pcl	the control matrix with annotation as obtained by $CTRL from make_matrices
tumor.pcl	the disease/test data matrix with annotation as obtained by $TEST from make_matrices
normalname	A name for the corrected control files
dataname	the name of the project
org.directory	where the outputs should be saved
A	integer if A=0 then the difference to the median is calculated otherwise the difference to the mean.
e	integer giving how far to the median an outlier is at least
meth	value or method that defines how to replace outliers, default is set to replace by the median
P	if more than P percent of features are outliers the feature is removed, by default all are kept
B	Batch vector a vector for normal and test samples with a same number corresponding to a same batch

Details

control_adjustment calculates a corrected control group, discovers outliers in it.

Value

Several files are created

paste(org.directory, normalname, ".normMesh", sep = "")

> The normal matrix with only common features with the test matrix. This file is only created if the two have different rows

paste(org.directory, dataname, ".normMesh", sep = "")

> The test matrix with only common features with the normal matrix. This file is only created if the two have different rows.

mean_vs_variance.pdf

> A pdf showing a plot of the mean (X axis) against the variances (Y axis) of each feature

mean_vs_variance_after_correction.pdf

> A pdf showing a plot of the mean (X axis) against the variances (Y axis) of each feature after correction of the control group

na_numbers_per_row.txt

> number of outliers per row

na_numbers_per_col.txt

> number of outliers per column

And values of ttmap_part1_ctrl_adj

e	Selected criteria for what is an outlier
tag.pcl	Annotation of features, ID of features and weight
Normal.mat	The control matrix without annotation and only with the common rows with Disease.mat
Disease.mat	The test/disease matrix without annotation and only with the common rows with Disease.mat
flat.Nmat	A list $mat being the corrected control matrix $m a record of the different numbers of removed genes per sample
record	numbers recording the number of columns in Disease.mat and Normal.mat
B	The batch vector B introduced in the begining
U1	The different batches in Normal.mat
U2	The different batches in Disease.mat

normalname = "The_healthy_controls",
dataname = "Effect_of_cancer",
org.directory = tempdir(), e = 0, P = 1.1, B = 0);
```

generate_correlation   *Generates different distance matrices*

Description

Single cell complete mismatch distance, single cell complete mismatch distance with a parameter
of cutoff, mismatch distance, correlation distance, p-value of correlation test distance and euclidean
distance.

Usage

```
generate_single_cell_complete_mismatch(ttmap_part1_hda,
select, alpha = 1)
generate_single_cell_mismatch_with_parameter(ttmap_part1_hda,
select, alpha = 1)
generate_correlation(ttmap_part1_hda, select)
generate_euclidean(ttmap_part1_hda, select)
generate_mismatch_distance(ttmap_part1_hda, select, alpha = 1)
generate_p_val_correlation(ttmap_part1_hda, select)
```

Arguments

ttmap_part1_hda

              an object given back by [hyperrectangle_deviation_assessment](#)

select   A sublist of rownames of ttmap_part1_hda$Dc.Dmat

alpha   A real number corresponding to a cutoff

Details

If one is interested only in clustering samples according to a list of genes belonging to a certain pathway, then this list is provided to the parameter select. Alpha is a cutoff for deviations that should be considered as noise, for gene expression data such as normalised RNA-seq or microarrays for instance a cutoff of 1, corresponding to a two fold change is being chosen.

Value

Distance matrix

Author(s)

Rachel Jeitziner

Examples

```
ttmap_part1_hda <- list()
ttmap_part1_hda$Dc.Dmat <- matrix(c(-1, 2, 0, -4, 5, 6), nrow = 2)
rownames(ttmap_part1_hda$Dc.Dmat) <- c("Gene1", "Gene2")
colnames(ttmap_part1_hda$Dc.Dmat) <- c("A", "B", "C")
dd <- TTMap::generate_mismatch_distance(ttmap_part1_hda, select =
rownames(ttmap_part1_hda$Dc.Dmat))
dd <- TTMap::generate_euclidean(ttmap_part1_hda, select =
rownames(ttmap_part1_hda$Dc.Dmat))
```

---

hyperrectangle_deviation_assessment

Calculation of deviation components

Description

[hyperrectangle_deviation_assessment](#) function calculates the hyperrectangle deviation assessment (HDA) that calculates the deviation components using normal_hda2 which calculates the normal component of the test sample and deviation_hda2 which calculates the deviation component.

Usage

```
hyperrectangle_deviation_assessment(x,
k = dim(x$Normal.mat)[2], dataname,
normalname,Org.directory = getwd())
```

Arguments

x	output object given back by [control_adjustment](#), list
k	A factor if not all the lines in the control group should be kept
dataname	the name of the project
normalname	A name for the corrected control files
Org.directory	where the outputs should be saved

Details

The function performs the hyperrectangle deviation assessment (HDA)

Value

Outputs

Tdis.pcl	The matrix of the deviation components for each test sample
Tnorm.pcl	The matrix of the normal components for each test sample
NormalModel.pcl	
	The normal model used

Values

Dc.Dmat	the deviation component matrix composed of the deviation components of all the samples in the test group
m	the values of the filter function per sample in the test group

```

---

make_matrices *Prepares the matrices for* control_adjustment

Description

make_matrices generates the control and the test matrice in the right format

Usage

```
make_matrices(mat, col_ctrl, col_test, NAME, CLID,
GWEIGHT = rep(1, dim(mat)[1]), EWEIGHT = 0)
```

Arguments

mat	the gene expressions can be **matrix**, **data.frame**, " RangedSummarizedExperiment", " ExpressionSet" format
col_ctrl	the columns in the matrix "mat" of the control samples
col_test	the columns in the matrix "mat" of the test samples
NAME	Name of genes,or annotation, e.g. WNT4
CLID	Identities of genes,e.g. ENSMUSG00000000001
GWEIGHT	the weight for each gene
EWEIGHT	the weight for each experiment

Details

make_matrices generates the test matrix and the control matrix in the format accepted by control_adjustment from a matrix object

Value

junk	A list containing $CTRL and $TEST the matrices to impute in control_adjustment

Author(s)

Rachel Jeitziner

---

make_matrices-methods   *Prepares the matrices for* control_adjustment

---

Description

make_matrices generates the control (output $CTRL) and the test (output $TEST) matrice in the right format for control_adjustment

Methods

signature(mat = "data.frame") Method make_matrice for data.frame object.

signature(mat = "matrix") Method make_matrice for matrix object.

signature(mat = "SummarizedExperiment") Method make_matrice for SummarizedExperiment object.

signature(mat = "RangedSummarizedExperiment") Method make_matrice for RangedSummarizedExperiment object.

signature(mat = "ExpressionSet") Method make_matrice for ExpressionSet object.

---

ttmap   *Visualisation of the clustering*

Description

Enables a quick view on the groups in the dataset (globally) and how locally they differ.

Usage

```
ttmap(ttmap_part1_hda, m1,
select = row.names(ttmap_part1_hda$Dc.Dmat),
ddd, e, filename = "TEST", n = 3, ad = 0, bd = 0, piq = 1,
dd = generate_mismatch_distance(ttmap_part1_hda = ttmap_part1_hda,
select = select), mean_value_m1 = "N", ni = 2)
```

Arguments

ttmap_part1_hda	list output of hyperrectangle_deviation_assessment
m1	either a user imputed vector whose names are the names of the samples with addition of .Dis. or by default it is the amount of deviation
select	Should all the features (default) or only a sublist be considered to calculate the distance
ddd	Annotation matrix with rownames the different sample names with addition of .Dis. There can be as many columns as wanted, but only the column n will be selected to annotated the clusters
e	integer parameter defining under which value two samples are considered to be close
filename	Name for the description file annotating the clusters
n	The column to be considered to annotate the clusters
ad	if ad!=0 then the clusters on the output picture will not be annotated
bd	if different than 0 (default), the output will be without outliers of the test data set (clusters composed of only "piq" element)
piq	parameter used to determine what small clusters are, see bd
dd	the distance matrix to be used
mean_value_m1	if == "N" the average of the values in m1 divided by the number of the samples are put into the legend (by default represents the average of the samples in a cluster of the mean-deviation of the features) otherwise it will show the average value of the values in m1 (is useful for instance if m1 represents the age of the samples)
ni	The column to consider to annotate the samples (is put into parenthesis) for the description file

Details

Is the Two-tiers Mapper function. The output is an interactive image of the clusters in the different layers.

Value

all	the clusters in the overall group
low	the clusters in the lower quartile group
mid1	the clusters in the first middle quartile group
mid2	the clusters in the second middle quartile group
high	the clusters in the higher quartile group

ttmap_sgn_genes_inter2(q, ttmap_part1_hda, alpha = 0)
ttmap_sgn_genes_inter(q, ttmap_part1_hda, alpha = 0)
```

Arguments

ttmap_part2_gtlmap
                output of [ttmap](#)

ttmap_part1_hda
                output of [hyperrectangle_deviation_assessment](#)

ttmap_part1_ctrl_adj
                output of [control_adjustment](#)

c   annotation file of the samples

n   column to give the name to the cluster

a   cutoff to be considered different than noise

filename   Name of the files

annot   annotation file

col   which column should be considered to annotate the features

path   where to put the output files

Relaxed   If Relaxed then one allows sample to be as the control and for all the others in
                one cluster to be going in the same direction (more than alpha) otherwise all the
                features must be deviating to be considered a significant feature

q   The sample in one cluster

alpha   cutoff to be considered different than noise inherited by a

Details

Is giving per cluster the features that vary in the same direction

Value

generates a file per cluster of significant features with an annotation

---

write_pcl   *Reading, writing and annotation files*

Description

Reading (read_pcl), writing (write_pcl) files and annotating matrices (mat2pcl)

Usage

```
mat2pcl(mat, tag)
write_pcl(df, dataname, fileaddress = "")
read_pcl(filename, na.type = "", Nrows = -1,
Comment.char = "", ...)
```

Arguments

df	PCL object to be saved
dataname	Name of the file
fileaddress	Where to save the file
filename	File name to be loaded on R
na.type	feels the parameter na.strings of read.table
Nrows	Number of rows to be ignored (nrows of read.table)
Comment.char	comment.char of read.table
...	other read.table arguments
mat	matrix to be changed in annotated
tag	annotation

Details

The file (called filename) MUST contain 3 columns before the actual values, which are called CLID, NAME and GWEIGHT, described bellow. The first row must be the header of the columns (starting with CLID,NAME and GWEIGHT) and the second row must be EWEIGHT. Representing how much weight each column has: if some columns are n replicates they can have each a weight of 1/n.

Value

Data frame composed of

CLID	Column called CLID which is the ID of the features, which will then be the rownames of the dataframe
NAME	A possibly longer name, more meaningfull than CLID, text format
GWEIGHT	A weight for each gene or feature. If some genes are less important than others or only a pathway should be selected than the file (called filename) should have this information
Matrix	The matrix with numbers of the different observations
